

## SYSTEM AND METHOD FOR DETERMINING CORRELATIONS IN A COMMUNICATIONS NETWORK

## ABSTRACT

The present invention provides a system and method for determining whether two or more parameters influence one another within a communications network by obtaining a set of measurements for two or more parameters. A correlation and a partial correlation between each of the parameters are then determined. A determination is then made as to whether the correlations and the partial correlations are statistically significant. Thereafter, a determination is made as to whether the two or more parameters, if any, influence one another based on the statistically significant correlations and partial correlations.
